

## **EXPLANATION OF THE COUNTERCYCLICAL BUFFER RATE FOR THE REPUBLIC OF SERBIA**

Based on Article 14, paragraph 1, item 11) of the Law on the National Bank of Serbia (RS Official Gazette, Nos 72/2003, 55/2004, 85/2005 – other law, 44/2010, 76/2012, 106/2012, 14/2015 and 40/2015 – CC decision and 44/2018), and Section 436 of the Decision on Capital Adequacy of Banks (RS Official Gazette, No 103/2016, hereinafter: Decision on Capital Adequacy), at its meeting held on 6 September 2018, the Executive Board of the National Bank of Serbia decided to keep the countercyclical buffer rate for the Republic of Serbia at 0%.

The Countercyclical Capital Buffer (hereinafter: CCyB) is additional Common Equity Tier 1 capital that banks are obligated to maintain above the prescribed regulatory minimum in the amount equal to their risk-weighted assets multiplied by the specific countercyclical buffer rate. This instrument mitigates the cyclical dimension of systemic risk, given that it creates an additional buffer of Common Equity Tier 1 capital during periods of excessive credit growth, which can be released when systemic risks materialise.

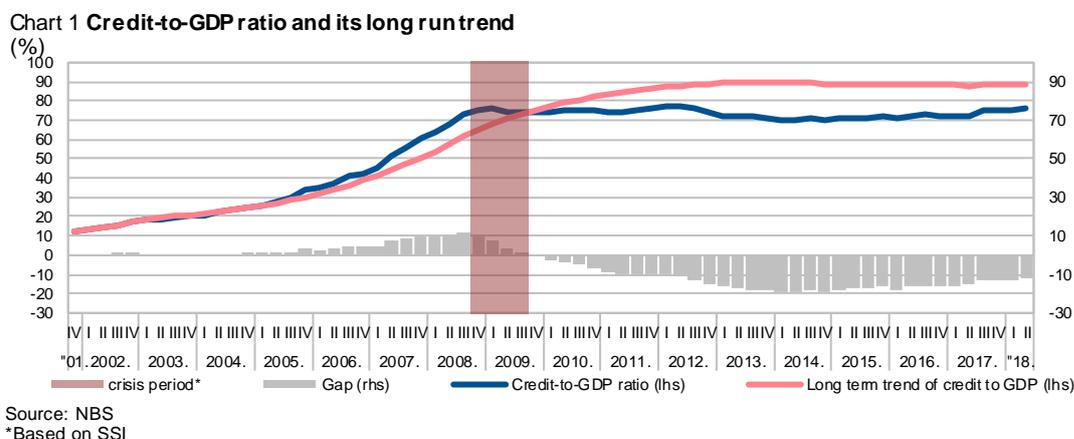

The National Bank of Serbia sets the CCyB rate for the Republic of Serbia on a quarterly basis, taking into account the buffer guide, applicable guidelines and recommendations of the European Systemic Risk Board and other variables it considers relevant for monitoring the cyclical dimension of systemic risk. In accordance with Section 436, paragraphs 2 and 3 of the Decision on Capital Adequacy, the guide for setting the CCyB rate is the deviation of the share of loans in GDP from long-term trends (credit-to-GDP gap). The CCyB rate for the Republic of Serbia is set in line with the recommendation for setting the CCyB rate of the European Systemic Risk Board (ESRB/2014/1).

Chart 1 shows the share of credit activity to the non-government sector in GDP, the long-term trend and the estimated credit-to-GDP gap.<sup>1</sup> Following a period of expanding credit activity between 2000 and 2008, the credit-to-GDP gap became negative in late 2009. June 2018 data show that the share of total loans in GDP equalled 75.7%, while the estimated credit-to-GDP gap was -12.4 percentage points. The estimated deviation and movements of the share of loans in GDP indicate that the current credit-to-GDP ratio is below its long-term trend and is entering the recovery phase, i.e. that the financial cycle is in a phase in which the introduction of a CCyB rate above 0% could constrain

---

<sup>1</sup> Starting from March 2018, the buffer guide applied in setting the CCyB rate is the share of loans to the non-government sector in GDP. In the prior period, the buffer guide was the share of lending to the non-government sector in GDP, which, in addition to loans, included given deposits, investment, securities and other financial assets, interest, fee and commission receivables and other lending.

credit activity. The estimated credit-to-GDP gap is below the benchmark value of 2 percentage points,<sup>2</sup> which means that the guide for setting the CCyB rate equals 0%.

To set the countercyclical buffer rate for the Republic of Serbia, in addition to the credit-to-GDP gap, additional optional indicators were also taken into account in accordance with Section 436, paragraph 4 of the Decision on Capital Adequacy. Optional indicators for monitoring lending activity were used, which illustrate the characteristics of the domestic financial system, and relate to the real estate market, external imbalance and banking sector developments.

## Real estate market

Real estate market indicators for the Republic of Serbia do not reveal any risk accumulation, and show instead that this segment of the financial market is recovering.

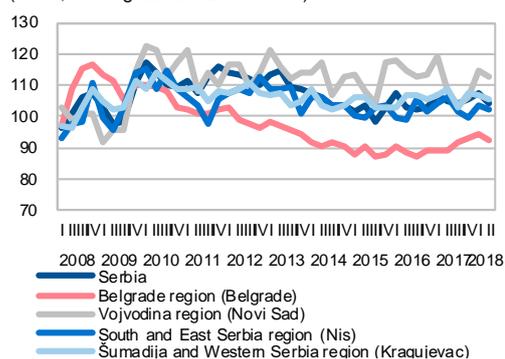

Serbia's average real estate price, as measured by DOMex, decreased at end-Q2 2018 by 0.3% y-o-y and by 2.9% q-o-q. This decline in the average estimated value of real estate does not imply that this trend is present at the global level. Rather, it resulted from seasonal and regional changes, with the strongest decline recorded in Eastern and Southern Serbia.

In the coming period, housing loan demand is expected to rise owing to lower interest rates, increased interbank competition, higher wages, and favourable real estate market trends.

<sup>2</sup> See: Recommendation of the European Systemic Risk Board of 18 June 2014 on guidance for setting countercyclical buffer rates (ESRB/2014/1), Annex Part II.

**Chart 3. Indices of the number of newly issued building permits**

(index, 2017 = 100)

Source: Statistical Office of the Republic of Serbia.

The recovery of the construction sector is indicated by the number of issued construction permits, which gained around 2.8% y-o-y at end-Q2 2018.

The average LTV ratio of new housing loans is still significantly below the regulatory maximum of 80%,<sup>3</sup> amounting to around 70.05% in Q2 2018.<sup>4</sup>

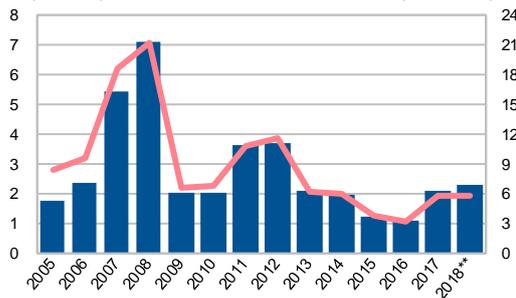

## Indicators of external imbalance

Improvement in domestic macroeconomic conditions reduces sensitivity to external risks. According to preliminary data, in H1 2018 the current account deficit measured 5.4% of GDP, down by 0.7 pp from the same period last year. Net FDI inflow was somewhat higher in H1 2018 compared to H1 2017, equalling EUR 1.3 bn. FDI is well-diversified and contributes to the country's export potential. Net FDI inflow is expected to fully cover the current account deficit in 2018.

<sup>3</sup> In accordance with the Decision on Measures for Safeguarding and Strengthening Stability of the Financial System (RS Official Gazette, Nos 34/2011 and 114/2017), banks may approve mortgage loans provided that the amount of the loan does not exceed 80% of the value of the property mortgaged, unless a loan is approved in the context of government support measures for some categories of natural persons, in which case the loan may not exceed 90% of the value of the property.

## Main banking sector indicators

The banking sector is adequately capitalised and highly liquid. A declining level of NPLs, the fact that there is no concentration of some types of assets in the banking sector, and the satisfactory degree of competition testify to the stability of the banking sector.

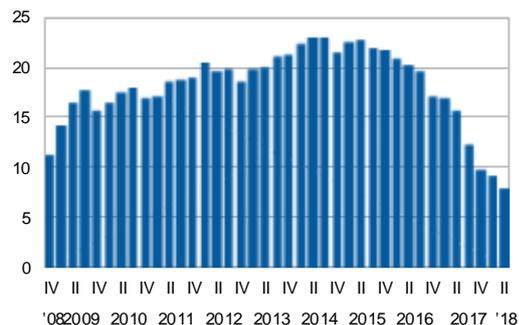

At end-Q2 2018, the capital adequacy ratio equalled 22.9%, well above the regulatory minimum (which as of 30 June 2017 equals 8%).

**Chart 6. Capital adequacy ratio**  
(%)

**Chart 7. Non-performing loans**  
(share in total gross loans, %)

Source: National Bank of Serbia.

The LtD ratio (ratio of loans to deposits) stayed below 1 at end-Q2 2018, indicating that banks rely more on domestic, stable sources of funding.

The share of NPLs in total loans of the banking sector continued to trend down in 2018, to 7.8% at end-Q2 2018, which is below the pre-crisis level. The

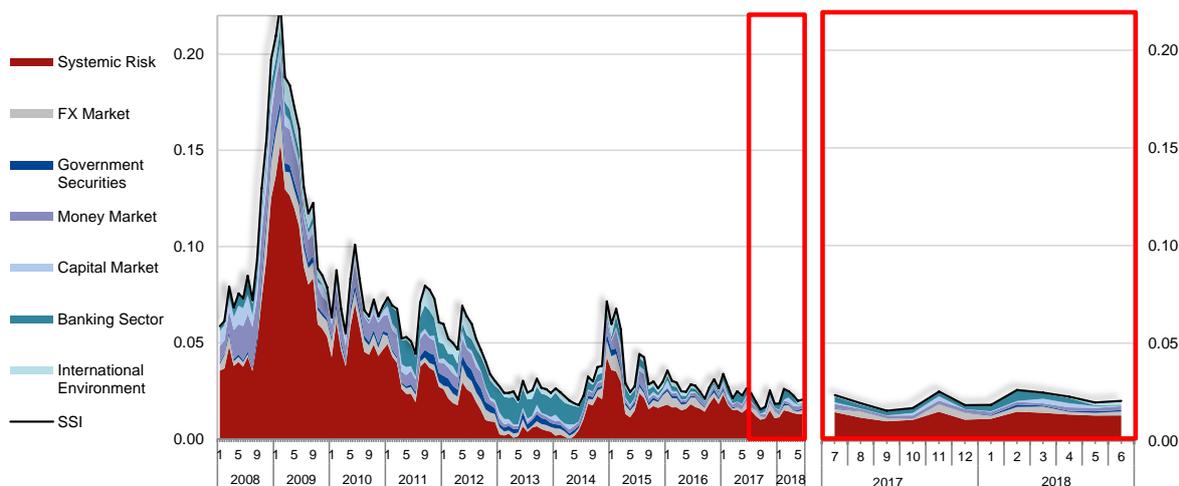

reduction in the share of NPLs largely resulted from activities implemented in accordance with the NPL Resolution Strategy and action plans of the Government and the NBS.

## Assessment of systemic risk of the Serbian financial system

The systemic stress indicator (hereinafter: SSI) was developed with a view to identifying periods of elevated stress and level of systemic risk in the financial system of the Republic of Serbia. The SSI covers a series of indicators which capture the level of financial stress in six key segments of the Serbian financial system: the FX market, government securities market, money market, capital market, banking sector and the international environment.

From June 2017 to June 2018, the SSI suggested a period of low risk, with a low and stable systemic component.

Chart 8 Systemic stress indicator dynamics and contribution of the most important risk factors to the Systemic stress indicator

Continued mild appreciation of the dinar against the euro and enduring movements in the FX market contributed to a low SSI in Q2 2018 as well. Relative to the same period last year, in Q2 2018, average EMBI for Serbia was lower by around 65 bp, which also confirms that the country risk premium, though somewhat above the lowest values on record from January, remains relatively low. Also, monetary policy easing, adequate level of required reserves and low interest rates in the euro money market marked the beginning of 2018 and had a positive impact on the domestic money market. Trends in the capital market in Q2 2018 did not significantly affect the level of systemic stress in the financial system of the Republic of Serbia. A systemic approach

and continuous improvement of regulatory measures conducted by the National Bank of Serbia resulted in an improvement in relevant banking sector indicators, which increased further the resilience of the financial system to potential shocks. Quarterly macroprudential stress tests of the banking sector carried out by the National Bank of Serbia confirm adequate capitalisation and high liquidity of the Serbian banking sector. Improvement of the business and investment environment, and narrowing in internal and external imbalances contribute to Serbia's increased resilience to potential negative effects from the international environment.

Low inflationary pressures, consistent implementation of fiscal consolidation measures and structural reforms, greater readiness of investors to invest in Serbia, as seen in the inflow of capital, monetary policy easing and a stable banking system contribute positively to strengthening the resilience of the domestic financial system, and consequently the country's macroeconomic stability.
